

**G4U**

Building Performance, Proven.

OPTIONAL PRODUCT-FAMILY EXTENSIONS

Extend building intelligence beyond energy.

Keep energy performance at the core while adding connected services that improve operating visibility, coordination and occupant experience.

01 Connected operations

IoT and building-system integration, IBMS views, FM workflows, work-order linkage and optional digital-twin experiences connect agreed asset and operating information.

02 Security, access and safety visibility

Connect security and access information, visitor processes and fire-safety visibility where useful. Dedicated life-safety and equipment-protection systems retain their own operating authority.

03 Occupant services

Extend the experience through meeting services, robotics, dining and shopping applications, selected around the building's needs and its service operators.

One product family. Clearly defined service scopes.

These are optional extensions to the G4U solution. Select their functions, data permissions and operating responsibilities separately from the AI energy-management core.

Extend the building experience where it adds value.

Add them alongside or after the energy-led deployment.
